

9.1.1 VOWELS IN A STRING

ALGORITHM

1. Start
2. Input string s
3. Initialize count = 0
4. For each character in string
5. Check if character is vowel
6. If yes, increment count
7. Print count
8. End

9.1.1. Count Vowels in a String - 1

Write a program that takes a string as input and prints the total count of vowels in that string. Consider both uppercase and lowercase.

Input Format:

- A single line contains a string that may contain letters, numbers, and punctuation.

Output Format:

- An integer representing the total number of vowels in the input string.

Sample Test Cases

vowel_co...

```
1
2 text = input()
3 vowels = "aeiouAEIOU"
4 count = 0
5 for char in text:
6     if char in vowels:
7         count += 1
8 print(count)
9
```

Average time

9.1.2 PALINDROME OR NOT

ALGORITHM

1. Start
2. Input string s
3. Reverse the string $\rightarrow \text{rev} = \text{s}[::-1]$
4. Compare s with rev
5. If equal $\rightarrow$ Print "Palindrome"
6. Else $\rightarrow$ Print "Not a Palindrome"
7. End

9.1.2. Palindrome or Not

Write a Python program to take a string as input and check whether the given string is a palindrome or not. A palindrome is a string that reads the same forwards and backward.

Input Format:

A single line of input contains a string

Output Format:

If the input string is a palindrome, print "Palindrome", otherwise print "Not a Palindrome"

Sample Test Cases

palindro...

```
1 s = input()
2 if s == s[::-1]:
3     print("Palindrome")
4 else:
5     print("Not a Palindrome")
```

Average time0.005 s5.00 ms

Maximum time0.006 s6.00 ms
