

1.1.2 Area of rectangle

Algorithm : 1 Start

2 Read the length l

3 Read the width w

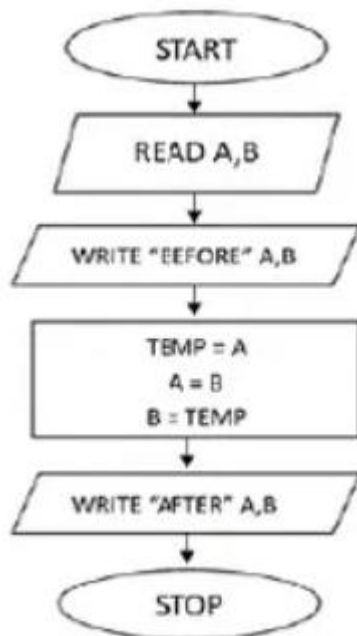

4 Calculate the area using the formula:

$\text{area} = l \times w$

5 Display the area formatted to 2 decimal places

6 Stop

Flowchart :

The screenshot shows the CODETANTRA web-based IDE interface. On the left, the problem statement for '1.1.2. Area of Rectangle' is displayed, including the formula $\text{Area of Rectangle} = \text{Length} \times \text{Width}$ and input/output specifications. The main editor on the right contains the following Python code:

```
1 length = float(input())
2 width = float(input())
3 area = length * width
4 print("{:.2f}".format(area))
5
```

Below the code editor, the execution results are shown. The average time is 0.006s and the maximum time is 0.009s. The output indicates that 5 out of 5 shown test cases and 5 out of 5 hidden test cases passed. A detailed view of Test case 1 shows the expected output as 18.5 and 54.68, and the actual output as 18.5 and 54.68, confirming the program's correctness.
