

1.1.4 Area of Triangle

Algorithm

1. Start the program
2. Read base value as float from first input line
3. Read height value as float from second input line
4. Calculate area = $(1/2) \times \text{base} \times \text{height}$
5. Display area formatted to 2 decimal places
6. Stop the program

Flowchart :

1.1.4. Area of Triangle

Write a Python program that prompts the user to enter the triangle's base and height and computes the triangle's area.

Formula: $\text{Area of Triangle} = 0.5 \times \text{base} \times \text{height}$.

Input Format:

- The first line of input is the float value that represents the base of the triangle.
- The second line of input is the float value that represents the height of the triangle.

Output Format:

- The output is the floating point value that represents the area of a triangle, formatted to two decimals.

Sample Test Cases

```
1 base = float(input())
2 height = float(input())
3 area = 0.5 * base * height
4 print("{:.2f}".format(area))
```

Test Results:

Test Case	Expected Output	Actual Output	Status
Test case 1	6.50	6.50	Passed
Test case 2	4.82	4.82	Passed

2 out of 2 shown test case(s) passed
2 out of 2 hidden test case(s) passed
