

8.1.1 MULTIPLICATION OF 2 MATRIX

ALGORITHM

1. Start
2. Read size n
3. Read matrix A
4. Read matrix B
5. Create empty matrix result of size $n \cdot n$
6. For each row i
7. For each column j
8. Set $\text{sum} = 0$
9. For $k = 0$ to $n-1$
10. $\text{sum} = \text{sum} + A[i][k] \cdot B[k][j]$
11. Store sum in $\text{result}[i][j]$
12. Display result
13. Stop

8.1.1. Multiplication of Two Square Matrices0/25

Write a Python program to perform the multiplication of two square matrices. The program should take two matrices as input and output their product.

Input Format:

- The first line prints the "dimension: " and reads an integer n , representing the dimensions of the square matrices ($n \times n$).
- The second line prints: "first matrix:" and then reads n lines, each containing n integers separated by spaces, representing the rows of the first matrix.
- Next line prints: "second matrix:" and then reads n lines, each containing n integers separated by spaces, representing the rows of the second matrix.

Output Format:

- Print "Resultant Matrix:" followed by n lines, each containing n integers separated by spaces, representing the product of the two matrices.

Sample Test Cases

Multiplica...

```
1 n = int(input("dimension: "))
2 print("first matrix:")
3 matrix1 = []
4 for i in range(n):
5     row = list(map(int, input().split()))
6     matrix1.append(row)
7 print("second matrix:")
8 matrix2 = []
9 for i in range(n):
10     row = list(map(int, input().split()))
11     matrix2.append(row)
```

8.1.2 PRIME NO IN A GIVEN RANGE

ALGORITHM

1. Start
2. Read start
3. Read end
4. Set found = False
5. For num from start to end
6. If num > 1
7. Set prime = True
8. For i from 2 to num
9. If num % i == 0
10. Set prime = False and break
11. If prime == True
12. Print num
13. Set found = True
14. If found == False
15. Print "No primes"
16. Stop

8.1.2. Prime Numbers in a Given Range

100%

🔍

🔗

⌵

Write a Python program to print all prime numbers within a given range (inclusive of both start and end values).

Input Format:

- First line contains an integer representing the start of the range.
- Second line contains an integer representing the end of the range.

Output Format:

- Print all prime numbers in the given range (including start and end if they are prime). Print each prime number on a separate line.
- If no prime numbers exist in the range, print: "No primes".
