

1.1.1 Area of Circle

Algorithm

1. Start
2. Input radius r
3. Set $\pi = 3.14$
4. $\text{area} = \pi \times r \times r$
5. Display area
6. Stop

1.1.1. Area of Circle

Write a Python program that calculates the area of a circle when the radius is provided by the user. Use $\pi = 3.14$ and display the area.

Input Format:

- A single line containing a floating-point number representing the radius.

Output Format:

- Print the computed area of the circle formatted to 4 decimal places.

Sample Test Cases

circlearea...

1 radius = float(input())

2 area = 3.14 * radius * radius

3 print(f"{area:.4f}")

Average time

0.003 s

3.29 ms

Maximum time

0.004 s

4.00 ms

2 out of 2 shown test case(s) passed

2 out of 2 hidden test case(s) passed

Test case 1

Expected output

35.4492

Actual output

35.4492

Test case 2

Terminal

1.1.2 Area of Rectangle

Algorithm

1. Start
2. Input length
3. Input width
4. $\text{area} = \text{length} \times \text{width}$
5. Display area
6. Stop

Flowchart :-

Program :-

1.1.2. Area of Rectangle

Write a Python program to calculate the area of a rectangle given its length and width.

Formula:
Area of Rectangle = Length $\times$ Width

Input Format:

- First line contains a float value representing the length of the rectangle
- Second line contains a float value representing the width of the rectangle

Output Format:

- Print the area of the rectangle as a float value formatted to 2 decimal places.

Sample Test Cases

```
1 length = float(input())
2 width = float(input())
3 area = length * width
4 print("{:.2f}".format(area))
5
```

Average time: 0.004 s (4.00 ms) | Maximum time: 0.008 s (8.00 ms) | 5 out of 5 shown test case(s) passed | 5 out of 5 hidden test case(s) passed

Test case 1 (4 ms)

Expected output	Actual output
18.5	18.5
5.2	5.2
54.68	54.68

Test case 2 (4 ms)

Terminal | Test cases

1.1.3 Calculate Area of Square

Algorithm

1. Start
2. Input side length
3. area = side $\times$ side
4. Display area
5. Stop

Flowchart :-

Program :-

The screenshot shows a web-based code editor interface. On the left, there's a problem description for '1.1.3. Calculate Area of the Square'. It asks to write a Python program that prompts the user to enter the *side_length* of a square and computes the area. The formula given is $\text{Area} = \text{side_length}^2$. The input format is a positive integer value for *side_length*, and the output format is a positive integer value for the area. Below this, there's a 'Sample Test Cases' section.

On the right, the code editor shows the following Python code:

```
1 side = int(input())
2 print(side * side)
3
```

Below the code editor, there's a test results section. It shows 'Average time: 0.002 s' and 'Maximum time: 0.003 s'. It also indicates '2 out of 2 shown test case(s) passed' and '2 out of 2 hidden test case(s) passed'. Below this, there's a table showing the results for 'Test case 1' and 'Test case 2'. For both, the 'Expected output' and 'Actual output' are 25.

Test Case	Expected output	Actual output
Test case 1	25	25
Test case 2	25	25

1.1.4 Area of Triangle

Algorithm

1. Start
2. Input base
3. Input height
4. $\text{area} = 0.5 \times \text{base} \times \text{height}$
5. Display area

6.Stop

Flowchart :-

Program :-

The screenshot displays a coding environment with the following components:

- Problem Statement:** "1.1.4. Area of Triangle. Write a Python program that prompts the user to enter the triangle's base and height and computes the triangle's area. Formula: $\text{Area of Triangle} = 0.5 \times \text{base} \times \text{height}$. Input Format: The first line of input is the float value that represents the base of the triangle. The second line of input is the float value that represents the height of the triangle. Output Format: The output is the floating point value that represents the area of a triangle, formatted to two decimals."
- Code Editor:** Contains the following Python code:

```
1 base = float(input())
2 height = float(input())
3 area = 0.5 * base * height
4 print("{:.2f}".format(area))
```
- Test Results:** Shows "2 out of 2 shown test case(s) passed" and "2 out of 2 hidden test case(s) passed".
- Test Case 1:** Expected output: 4.34, Actual output: 4.34.
- Test Case 2:** Expected output: 4.82, Actual output: 4.82.
